LMCurbS

LMCurbS is a major provider of roof curbs, S-5! snow retention systems and roof accessories to the metal roof and metal building industry, and has established itself as a leading supplier of quality products. With the addition of employees and CNC operated equipment, LMCurbS is expanding its facilities and planning for future growth.

Roof Curbs

Much consideration is given to the type of roof system on a new building or reroof. Equal consideration should be given to the roof penetrations and the type of curb used. The standing seam curb pictured exemplifies LMCurbS' capability to design an aluminum (.080" or .125" metal thickness) curb to correctly match your roof system. The highs fit under the roof panel on the up slope and over on the down slope to create a continuous water flow. Our curb base sides extend to the next natural seam of the roof panel, then the cap strips seal the seam. This method of installation makes the curb an integral part of the roof system.

To complement the LMCurb, we offer roof floating framing packages (sub-frame package) that will provide everything you need to install roof curbs

including support channels, back-up plates, sealant tape, caulking and screws. The roof curb will be a minimum height of 8" above the finished roof, crickets are standard and all seams are continuously welded watertight. The roof curb can also be offered with a few options—shop painted to color match your roof panel, insulated with 1-1/2" - 3# foil faced fiberglass and installation of partitions for roof top a/c equipment as examples.

S-5! Snow Retention Systems

There are numerous types of snow retention systems on the market today. How do you choose the right system for your project? There are a few major features that are the most important—the use of set screws for a mechanical non-penetrating attachment, holding strength, continuous bar system and color matching abilities. All systems use the S-5! Clamps that attach to the standing seam of the roof panel by tightening the bullet nose set screws that will slightly dimple, but will not cut or penetrate the panel seam. Because the attachment is mechanical, it can be installed at any

A WIDE RANGE OF ROOFTOP ACCESSORY NEEDS MET BY LMCURBS

time of the year and does not rely on adhesive cure times or temperatures. Furthermore, because of the tremendous holding strength of the S-5! clamps, typically one continuous assembly along the roof's eave is sufficient for most applications. This reduces both material and installation costs when compared to other systems.

The S-5! SnoRail and SnoFence utilize SnoRods to create a continuous snow retention system along the eave of the building. All components are mill finished aluminum and stainless steel (also available in brass). The S-5! ColorGard is a continuous snow retention system that allows you to color match your roof with the addition of a color strip. The color strip is your flat stock material or

roofing material sheared to size (2" wide x 96" long) that slides into the front of the ColorGard bar. ColorGard quickly became the snow retention system that architects, contractors and building owners prefer to have on their projects.

Roof Accessories And Services

We offer roof walkway systems, roof hatches, skylights, smoke vents, dek-tites, fans, louvers, snow diverters and equipment supports. LMCurbS offers design capabilities for all of its products, including AutoCAD drawings, specifications and submittal packages. LMCurbS has this information (pictures, technical information, specifications, fill out our online quote form, etc.) available on our website or you can contact us by phone Monday-Friday.
